Professional Summary

Senior Backend Engineer with 9+ years of experience architecting highly concurrent, event driven distributed systems. Expert in API design, microservices architecture, and performance optimization, with a proven track record of solving complex system level challenges and improving business throughput.

Skills

Languages: Golang, Python, Haskell, C#, Javascript, SQL, Bash

Frameworks/Runtimes: Gin, Chi, FastAPI, Flask, Node

Cloud & Tooling: GCP, AWS, Cloud Run, Kubernetes, Docker, Pub/Sub, Kinesis, NATS

AI-Assisted Development: Claude, Gemini, AI-Integrated Testing, Prompt Engineering

Databases: BigQuery, Spanner, PostgreSQL, MySQL, MongoDB, Redis

Data & ETL: Apache Beam, dbt, Jupyter Notebooks

Workflows/Orchestration: Temporal

APIs & Messaging: gRPC, REST, Protobuf, WebSockets, OAuth/JWT

Experience

Oolio - Senior Software Engineer (Backend - Golang)

Mar 2026 - Current

- Architected and implemented an event-driven inventory depletion engine in Go (PostgreSQL, NATS JetStream) that auto-deducts stock from POS orders and production runs via a recipe/container cascade, with an idempotent Reserve - Commit - Reverse lifecycle safe against event replay and duplicate ingestion.
- Built organization level authorization for the Products API using Open Policy Agent (OPA) and ReBAC, extracted policies into a standalone Kubernetes sidecar and enforced granular, location scoped access control behind a feature flag with zero impact to existing tenants.
- Delivered both systems on a domain driven, hexagonal Go architecture with 600+ tests, including a testcontainer backed integration suite (real PostgreSQL + NATS) for end to end correctness.

ANZ - SDE 3 (Backend - Golang, Python)

Feb 2024 - Feb 2026

- Architected an event-driven data pipeline in Go on Cloud Run that decouples systems via Pub/Sub events, parsing and loading into BigQuery to enable async processing, analytics, and data product consumption across teams.
- Built scalable data products using dbt transformations on BigQuery, delivering standardized datasets that accelerated reporting and experimentation for multiple consumption teams.
- Engineered CI/CD pipelines with GitHub Actions, automating deployments and proof-gathering to cut release turnaround time and boost deployment reliability.

- Rewrote legacy Java loan simulation tool in Go, enhancing maintainability and enabling rapid validation of credit decision rulesets for analytics generation.
- Implemented Cloud Run based validation system using Jupyter Notebooks to verify post-credit decision loan outcomes, ensuring data integrity across pipelines.
- Developed gRPC APIs and extended credit decisioning system features, supporting new lending scenarios with improved security and performance.

Sequoia - Backend Engineer (Backend - Golang, Python, Node) Dec 2021 – Feb 2024

- Architected and implemented the backend service for employment offer management system in Go and MongoDB, orchestrating end-to-end lifecycle from offer creation through digital acceptance.
- Engineered Redis-MongoDB hybrid caching layer, reducing query latency and database load while maintaining data consistency across distributed microservices.
- Designed state machine-based workflow engine with event-driven callbacks, enabling complex multi-stage offer approval processes with automated notifications.
- Established comprehensive unit testing framework with CI integration, improving code coverage and enabling rapid feature iteration with confidence.
- Built production-grade client-side encryption system for S3 document storage with secure one-time access links, including zero-downtime migration tooling for existing files.
- Implemented high-performance goroutine worker pool with dynamic scaling and graceful shutdown, improving document generation throughput by 3x while preventing resource exhaustion.

Juspay - Software Development Engineer (Backend - Haskell) Jun 2021 - Dec 2021

- Architected an event-driven, OCEN compliant loan origination system in Haskell utilizing Redis Streams for asynchronous processing, orchestrating complex integrations across loan service providers, account aggregators, and credit bureaus for real-time borrower assessment
- Built a flexible business rule engine with configurable decision trees, enabling lenders to define custom credit policies while maintaining regulatory compliance and audit trails.
- Re-engineered loan application onboarding flow with progressive disclosure and intelligent form validation, achieving improvements in completion rate (27% to 91%).

Aurigo - Senior Software Engineer (Backend - C#) Jun 2017 - May 2021

- Architected an end to end state contract procurement platform, automating bidding workflows and ensuring seamless, real time financial synchronization with legacy systems.
- Optimized unit price search via advanced caching, significantly reducing search latency and enhancing bid preparation efficiency for department stakeholders.

Education

Sri Jayachamarajendra College of Engineering
B.E. Electronics and Communication

Aug 2013 - May 2017
CGPA: 8.59/10
